GENERAL INFORMATION:

APPLICANT:

KNUTZON, DEBORAH MURKERJI, PRADIP

APPLICANT: HUANG, YUNG-SHENG
APPLICANT: THURNOND, JENNIFER
APPLICANT: CHAUDHARY, SUNITA
TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR SYNTHESIS
TITLE OF INVENTION: OF LONG CHAIN POLY-UNSATURATED FATTY ACIDS IN PLANTS

```
; LENGTH: 457 amino
; TYPE: amino acid
; STRANDEDNESS: not
; TOPOLOGY: linear
; MOLECULE TYPE: pepti

CC The present sequence represents a Mortierella alpina fatty acid delta-6 CC desaturase enzyme. The enzyme sequence is used in the methods of CC the invention. The specification describes methods for desaturating a CC fatty acid and for producing a desaturated fatty acid by expressing CC increased levels of a desaturate. The present desaturase is an enzyme CC which introduces a double bond carbons 6 and 7 from the carboxyl end of CC a fatty acid molecule. The enzyme can be used for desaturating fatty CC acids. The enzyme can be used to produce polyunsaturated fatty acids, CC which can be used for treating malnutrition, in pharmaceutical CC compositions, in cosmetics or in animal feed. The polyunsaturated fatty cids caids can be used for treating e.g. restenosis after angioplasty, CC inflammation, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes CC or eczema or reduce blood pressure. They can also be used to inhibit conhibit proliferation of vessel wall smooth muscle and fibrous tissue, CC inhibit proliferation of vessel wall smooth muscle and fibrous tissue, CC caused by non-steroidal anti-inflammatory drugs, prevent or treat CC and chronic fatigue after viral infections, treat myalgic encephalomyelitis CC caused by non-steroidal anti-inflammatory drugs, multiple CC sclerosis, acute respiratory vendrome, hyperfension and inflammatory acids infammatory and inflammatory acids and infammatory acids in the control of the control of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```
This represents a Mortierella alpina delta 6 desaturase. The invention crelates to a nucleic acid construct that contains at least one of the nucleotide sequences (AAN/0089) to AAA/00891) encoding M. alpina delta 6, delta 12 and delta 5 desaturases (AAN/0504) to AAN/0506) respectively, coupled to an expression control sequence functional in plants. Recombinant plant cells containing at least one DNA encoding a M. alpina delty acid desaturase (FAD), can be used for the production of plants containing them are used to produce oils such as linoleic acid, containing them are used to produce oils such as linoleic acid, arachidonic acid, gamma-linolenic acid, dihomo-gamma-linolenic acid, arachidonic acid and eicosapentaenoic acid (EPA). These plant oils are used: (1) to treat malnutrition; (ii) in infant feeding formulas, or clietary supplements or substitutes, for use in humans or animals; (iii) for treating disorders associated with inadequate consumption or production of PUFA (or their metabolites such as prostaglandins), e.g. restenosis after angioplasty, inflammation, AIDS, rheumatoid arthritis, psoriasis, osteoporosis, cancer, eczema, diabetes; (1) as cosmetics, and (1) as animal feeds. Fragments of the DNA are used as probes to isolate
                                                      related coding sequences. Recombinant plants can produce high yields of PUFA, since new pathways can be created and unwanted ones suppressed. Plants can be engineered to express oils of particular PUFA composition, e.g. one similar to that in human milk, and product recovery is simpler
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid construct able to express fatty acid desaturase in plants - useful in human or animal nutrition, as cosmetics and therapeutically, e.g. for restenosis, cancer and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polyunsaturated fatty acid; linoleic acid; arachidonic acid; linolenic; stearidonic acid; eicosapenteaenoic acid; minutrition; stearidonic acid; eicosapenteaenoic acid; minutrition; inflammation; dietary supplement; prostaglandin; restenosis; angioplasty; inflammation; rheumatoid arthritis; psoriasis; osteoporosis; cancer; eczema; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The fatty acid desaturases are able to catalyse the conversion of oleic cc acid to linoleic acid, linoleic acid to gamma-linolenic acid or of capha-linolenic acid to stearidonic acid. Transgenic Insect cells cc mprising a nuclectide sequence which encodes a polypeptide comprising comprising a nuclectide sequence which encodes a polypeptide comprising cc residues 50-53, 39-43, 172-176, 204-213, or 390-402 of delta-6 cc desaturase (AAY92599) or comprising delta-12 desaturase (AAY92600) are cc claimed. Oil and fatty acids (especially gamma-linolenic acid) isolated from the recombinant insect cells are also claimed. Production of compositions as insect cells have greatly simplified lipid compositions, as insect cells have greatly simplified lipid compositions, are not subject to external variable fluctuations, and can easily be compositions, infant formulas, dietary supplements or substitutes, and concentics (all claimed). The PUFA supplements or substitutes, and concentics (all claimed). The PUFA supplements have antiinflammatory, antirheumatic, antiasthmatic, antipsoriatic, osteopathic, cytostatic, continitions, nephrotropic, vasodilator, antiaggregant and vasotropic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cells are produced by transforming cells, e.g. embryonic stem cells, with nucleic acid encoding heterologous enzymes involved in fatty acid, e.g. long chain or polyunsaturated fatty acid (PFA) biosynthesis. This sequence corresponds to a fungal delta6-desaturase whose coding sequence is an example of a nucleic acid sequence used to transform the cells. The essential FAs obtained can be used in nutritional formulations or animal feed formulations. The long chain PFAs can be used in nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     downstream products such as leukotrienes, thromboxanes, arachidonic acid, eicosapentaenoic acid or docosahexaenoic acid. The products can also be used in cell culture. The animal or milk fat produced can be administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    feed formulations. The long chain PFAs can be used in nutritional formulations, cosmetic formulations or animal feed formulations. The products can also be used for producing transgenic animals which can used for producing essential FAs which can be used for producing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         В
                       polynucleotide sequence was used to trasfect mammalian cells, to produce animal cells expressing a desaturase gene and/or an elongase gene. Compositions comprising cells of the invention are useful for synthesising essential fatty acids, their derivatives or downstream products, as well as altered levels of long-chain polyunsaturated fatty acids and elcosanoids. The compositions are useful in nutritional formulae, e.g. infant formula, dietary supplements or dietary substitutes for both humans and animals. The compositions are also useful in cosmetic or animal feed formulations. Furthermore, the compositions may also be used as fat free media or as research reagents.
                                                                                                                                                                                                                                 New compositions comprising cells that express desaturases and elongases, for synthesizing essential fatty acids or long-chain polyunsaturated fatty acids, used in nutritional, cosmetic or a

```
The present sequence represents a fatty acid delta-6 desaturase enzyme. The specification describes methods for desaturating a fatty acid and for producing a desaturated fatty acid by expressing increased levels of a desaturase. The present desaturase is an enzyme which introduces a double bond carbons 6 and 7 from the carboxyl end of a fatty acid molecule. The enzyme can be used for desaturating fatty acids. The enzyme can be used for treating malnutrition, in pharmaceutical compositions, be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty, inflammation, reduce blood pressure. They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol levels, inhibit proliferation of vessel wall smooth muscle and fibrous tissue, reduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat endometriosis and premenstrual syndrome, treat myalgic encephalomyelitis and chronic fatigue after viral infections, treat along multiple
                                                                                    sclerosis,
                                                                              acute respiratory syndrome, hypertension and inflammatory skin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         increased levels of a desaturase. Desaturases can be used for desaturating fatty acids. The enzymes can be used for produce polyunsaturated fatty acids, which can be used for treating malnutrition, in pharmaceutical compositions, in cosmetics or in animal feed. The polyunsaturated fatty acids can be used for treating e.g. restenosis after angioplasty inflammation, rheumatoid arthritis, asthma, psoriasis, cancer, diabetes or eczema or reduce blood pressure. They can also be used to inhibit platelet aggregation, cause vasodilation, lower cholesterol levels, inhibit proliferation of vessel wall smooth muscle and fibrous tissue, reduce or prevent gastro-intestinal bleeding and other side effects caused by non-steroidal anti-inflammatory drugs, prevent or treat endometriosis and premenstrual syndrome, treat myalgic encephalomyelitis and chronic fatigue after viral infections, treat AIDS, multiple sclerosis, acute respiratory syndrome, hypertension and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated fatty acid desaturase enzymes - used for the production of polyunsaturated fatty acids for use in, e.g. pharmaceutical compositions, nutritional compositions, cosmetics or animal feed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   malnutrition; inflammation; rheumatoid arthritis; asthma; psoriasis; cancer; diabetes; eczema; platelet aggregation; vasodilation; cholesterol level; endometriosis; premenstrual syndrome; myalgic encephalomyelitis; chronic fatigue; AIDS; multiple sclerosis; acute respiratory syndrome; hypertension; inflammatory skin disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a peptide derived from a desaturase enzyme. The specification describes methods for desaturating a fatty acid and for producing a desaturated fatty acid by expressing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                       activity. The invention also describes (a) amino acid sequences encoded (b) (I); (b) an expression cassette (EC) containing (I) linked to one or comore regulatory sequences; (c) a vector containing (I) and EC; (d) (c) organisms containing (I), EC or the vectors of (c); (e) preparation of (c) consaturated fatty acids (A) or triglycerides (Mo) with increased content (c) of (A) by introducing (I) or EC into an oil-producing organism; (f) (c) proteins (IIa) of 172 as or 178 as (given in the specification); (g) (c) production of (A) or TG by using (Ia); and (h) (A) and TG produced by (c) method (g). (I) are used to produce transgenic plants (or other (c) organisms) that produce oils or triglycerides (TG) with increased content (c) unsaturated fatty acids (A) and to isolate related sequences by (c) method (g). (a) or TG containing them, are useful in human (c) nutrition (e.g. infant foods), animal feeds, pharmaceuticals and (c) completes expression of (II), resulting in oils with
Sequence
                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding delta6-acetylenase or desaturase, useful for producing plant oils with increased content of unsaturated fatty as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-JUN-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                       δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel isolated nucleic acid (I) encoding CC polypeptides (II) with Delta6-acetylenase and/or Delta6-desaturase CC activity. The invention also describes (a) amino acid sequences encoded by (I); (b) an expression cassette (EC) containing (I) linked to one or CC more regulatory sequences; (c) a vector containing (I) and EC; (d) CC organisms containing (I), EC or the vectors of (C); (e) preparation of CC unsaturated fatty acids (A) or triglycerides (TG) with increased content of (A) by introducing (I) or EC into an oil-producing organism; (f) CC production of (A) or TG by using (Ia); and (h) (A) and TG produced by CC method (g). (I) are used to produce transgenic plants (or other CC organisms) that produce oils or triglycerides (TG) with increased content CC of unsaturated fatty acids (A) and to isolate related sequences by CC homology screening. (A), or TG containing them, are useful in human CC nutrition (e.g. infant foods), animal feeds, pharmaceuticals and CC cosmetics. Derivatives of (I), e.g. antisense sequences or ribozymes, CC can be used to suppress expression of (II), resulting in oils with CC increased content of saturated fatty acids.

                                                                                                                 produce transgenic plants, especially crop plants, with an increased or decreased delta-8 unsaturated long-chain base content or an altered delta-8 unsaturated long-chain base content or an altered compensate for a delta-8 -unsaturated long-chain base defta-lency, to exclude production of delta-8-unsaturated bases, to increase tolerance or resistance to soil salinity, ion stress or toxicity, drought, wet conditions, cold or frost and/or phytopathogenic microorganisms or later size growth and flowering time. Cells, transgenic organisms or plants containing the DNA sequence can be used to produce sphingolipids and capnoids with unsaturated sphingobases. The sphingolipids or capnoids can be used in cosmetics, pharmaceuticals and foods and as chemical raw materials. This sequence represents a protein which has delta6 fatty acid desaturase activity which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                     introduces a double bond into the sphingobase of the ceramide residue sphingolipids and capnoids. A DNA sequence encoding the sphingolipid desaturase, or a vector containing the DNA sequence, can be used to
                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel sphingolipid desaturase that selectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transgenic plant; crop plant; delta-8-unsaturated long-chain base; tolerance; resistance; soil salinity; ion stress; toxicity; drought; cold; frost; phytopathogenic microorganism; flowering time; cosmetic; pharmaceutical; food; chemical raw material.

This invention describes a novel preparation of unsaturated fatty acid (I) by introducing into an organism at least one isolated nucleic acid (II) that encodes a polypeptide (III) with Delta6-desaturase activity. Organisms that contain at least with (I), on total fatty acid conten are then selected. (II) is selected from: (a) a 2012 bp sequence (S1), defined in the specification, or its equivalents within the degeneracy
                                                                                                                                                                                                                                          Production of unsaturated fatty acids, useful e.g. in nutrition, cosmetics or pharmaceuticals, in organisms transformed with Physcomitrella patens delta-6-desaturase nucleic acid -
                                                                                                                                                                                                                                                                                                                                                                                                                                  Heinz

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the genetic code; or (b) derivatives of the sequence of (a) that encode a 525 amino acid polypeptide ($2), defined in the specification, or a polypeptide with at least 508 homology with ($2) and practically the same enzymatic activity. The invention also describes (1) transgenic organisms that contain (II); and (2) oils, lipids and fatty acids produced by the new method. The oils, lipids and fatty acids produced by the transformed organisms are used in human or animal nutrition, cosmetics, pharmaceuticals and agricultural chemicals. (III) constains be used, in vitro, for increasing the (I) content of triglycerides. The transgenic organisms have increased contents of (1), or of (I)-containing triglycerides, particularly of gamma-linolenic acid.

The cDNA sequence is useful for recombinant production of the enzyme and for generating transformed host cells and transgenic plants. The desaturase can be used for creating a double-bond between two carbons in particular, the enzyme is useful for producing polyunsaturated fatty acids and for generating enzyme-specific antibodies useful for identifying desaturases. Oil-seed plants may be engineered to incorporate the enzyme, so that the plants produce seed oil rich in fatty acids. The fatty acids could be incorporated usefully into infant formula, foods of formulation clearly supplements, nutriceutical and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Purified protein having double-bond between two

                                                                                                                                               genes can be used in gene therapy as a preventative treatment, e.g. in patients suffering from high levels of coblesterol or other conditions where administration of polyunsaturated fatty acids may have beneficial disease preventative effects. The polyunsaturated fatty acids can be used in foodstuffs or dietary supplements. The Delta 5-fatty acid desaturases
                                                                                                                  in foodstuffs or dietary supplements. The Delta 5-fatty acid desaturases can also be used for the synthesis of prostaglandins or modulation of the synthesis. The products can also be used for detection and diagnosis. The
                                                                         Sequence
                                                                                                                                                                                                                          The invention provides delta 5-fatty acid desaturases obtained from Mortierella alpina and Caenorhabditis elegans. The Delta 5-fatty acid desaturases catalyze the production of polyunsaturated fatty acids, e the conversion of dihomogamma linolenic acid to arachidonic acid. The

                                                                                                 This is the Caenorhabditis elegans fatty acid delta-5 desaturase. The CDNA sequence is useful for recombinant production of the enzyme and for generating transformed host cells and transgenic plants. The desaturase can be used for creating a double-bond between two carbons. In particular, the enzyme is useful for producing polyunsaturated fatty acids and for generating enzyme-specific antibodies useful for identifying desaturases. Oil-seed plants may be engineered to incorporate the enzyme, so that the plants produce seed oil rich in fatty acids. The fatty acids could be incorporated usefully into infant formula, foods of all kinds, dietary supplements, nutriceutical and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       C. elegans fatty acid delta-5-desaturase
